

“Assuring Healthcare Excellence through Digital Technology”

“The healthcare industry is in a state of transition. New quality standards are being developed for medical devices while digital technology is reinventing the concept of healthcare. The challenge of this technological turbulence is managing in an age where the half-life of innovations is calculated in months rather than years. Digital technology has already taken over the operations of medical records and it is moving into diagnostics and surgery. Within very few years surgical operations will be converted into high-technology centers that use “digital doctors” who collaborate with human surgeons who are assisted by robotic surgeons that perform the delicate operations as guided by nano-bots that provide real-time sensor readings. No, wait – that is already happening today! Wait until you see what the future has in store to change the way the healthcare industry delivers excellence to patients!”
